Rubber-fabric oil resistant conveyor belts

Application

Rubber-fabric oil resistant conveyor belts are designed for the transportation of loose materials of any granulation (considering the operational safety of the conveyor and belt, granulation is recommended not to exceed 300 [mm] of transported material) containing oil and fat of organic or mineral origin. Application details are provided in **Table 1**.

Structure

Rubber-fabric oil resistant conveyor belts are composed of 2- to 5-ply fabric and rubber carcass, carrying and running rubber covers and rubber edges. A layer of carcass rubber is placed between textile plies.

In terms of the design, dimensions of belts and their elements, tolerances of dimensions, joints of rubbertextile plies and strength parameters, belts comply with the PN-EN ISO 14890 standard. Depending on its type, the oil resistant conveyor belt meets requirements concerning 1, 2A or 2B safety category acc. to PN-EN 12882. To protect the carcass against high temperatures, TG 100 oil resistant belts are manufactured with rubber linings with a minimum recommended thickness of 4+2 [mm], while belts TG 150 with rubber linings with a minimum recommended thickness of 5+2 [mm].

Rubber-fabric oil resistant conveyor belts are manufactured in accordance with WT-6 and are generally made of an EP (polyester-polyamide) fabric ply. At the request of the customer, belts may be made of a PP (polyamidepolyamide) fabric ply.

Covers thickness

The minimum thickness of a carrying cover (S_1) for G, GG, GK, GS, FK, GRK belts is 2 [mm].

The minimum thickness of a carrying cover (S_1) for TG100 belts is 4 [mm].

The minimum thickness of a carrying cover (S_1) for TG150 belts is 5 [mm].

The minimum thickness of a running cover (S_2) for every type of belt is 2 [mm].

The maximum recommended thickness of a carrying cover (S₁) is 8 [mm].

The maximum recommended thickness of a running cover (S_{2}) is 6 [mm].

Belt designation used for ordering purposes

Table 1. Classes of oil-resistant belts

| Class of the belt | Transported material | Temperature of transported material [°C] | Ambient temperature [°C] | Additional properties of the belt | Additional pro- perties of the belt carcass | Safety category |
|-------------------------|---|---|--------------------------------|--|---|--------------------|
| G | Containing mineral, vegetable oil and animal fat | from -15 to +60 | from -15 to +60 | - | - | 1 |
| GG | Containing mineral, vegetable oil and animal fat | from -15 to +60 | from -15 to +60 | - | oil resistant | 1 |
| GK | Containing mineral, vegetable oil and animal fat | from -10 to +60 | from -10 to +60 | non-inflammable | - | 2A |
| GS | Containing mineral, vegetable oil and animal fat | from -10 to +60 | from -10 to +60 | non-inflammable | non- inflammable | 2B |
| FK | Containing vegetable oil and animal fat | from -20 to +60 | from -20 to +60 | non-inflammable | - | 2A |
| GRK | Containing vegetable oil and animal fat | from -30 to +60 | from -30 to +60 | non-inflammable | - | 2A |
| TG100 | Containing mineral, vegetable oil and animal fat | from -10 to +100 | from -10 to +60 | resistant to incre- ased temperatures | - | 1 |
| TG150 | Containing mineral, vegetable oil and animal fat | from -10 to +150 | from -10 to +60 | resistant to incre- ased temperatures | - | 1 |

Belt thickness

Table 4 shows approximate thickness of carcasses for rubberfabric oil resistant conveyor belts of any type. Approximate total thickness of a belt containing covers of any thickness may be calculated using the following equation:

 $S = S_3 + (S_1 + S_2)$

where:

- S approximate total thickness of the belt [mm]
- S₂ thickness of the belt carcass taken from Table 4 [mm]

 $S_1 -$ thickness of a carrying cover [mm]

 S_{2} – thickness of a running cover [mm]

Belt weight

Table 4 shows approximate weight of carcasses for rubberfabric oil resistant conveyor belts of all types. Approximate weight of a belt containing covers of any thickness may be calculated using the following equation:

$$M = m_1 + X^*(S_1 + S_2)$$

where:

M – approximate weight of the belt [kg/m²] m_1 – weight of the belt carcass taken from Table 4 for a specific type of the belt [kg/m2]

- S₁ thickness of a carrying cover [mm]
- S_{2} thickness of a running cover [mm]
- \bar{X} value depending on the type of the belt:

- for G, GG – 1.18 [g/cm3]

- for GK, GS 1.27 [g/cm3]
- for FK 1.265 [g/cm3]
- for TG100 1.18 [g/cm3]
- for TG150 1.17 [g/cm3]
- for GRK 1.39 [g/cm3]

Belt dimensions

Dimension tolerances - compliant with PN-EN ISO 14890. Allowable tolerance for belt width is:

WT-6/18 450 1000 FP 800 4 6+2 G 1

- for width exceeding 500 [mm]: ± 1[%]
- for width of up to 500 [mm]: ± 5[mm]
- Allowable tolerance for belt total thickness is:
- for thickness exceeding 10 [mm]: ± 10[%]
- for thickness of up to 10 [mm]: ± 1[mm]
- Allowable tolerance for cover thickness is:
- for lining thickness of up to 4 mm: +1/-0.2 [mm];
- for lining thickness exceeding 4 mm: +1 [mm]/-5 [%].

Standard lengths: 100, 150, 200, 250, 300 [m].

Minimum diameter of drums

Table 5 shows recommended minimum diameters of drums [mm] for belts, for the load range of 60-100%, which were determined in accordance with DIN 22101:

- A drive pulleys and other pulleys in the range of high belt tensions
- B deflection pulleys and other pulleys in the range of low belt tensions
- C snub pulleys (change in belt movement direction by $\leq 30^{\circ}$)

Belt markings

Typically, a durable stamp in the form of a rubber relief is impressed on the carrying cover of the belt at the distance of $1\div3$ [m] from the beginning and the end of the belt and approximately every 20 [m]. The stamp includes manufacturer's name, markings acc. to the abovementioned pattern (excluding length, width, or thickness of covers), belt serial number, and last two digits of the manufacturing year.

Packing

Typically, the belt is warped on wooden core being 450 [mm] in diameter and having an internal square hole with a 230 [mm] cheek. Warped belts are protected against unwinding during transport by wrapping with polypropylene tape.

Diameter of the roll

Approximate diameter of the roll D [m] with length L [m], and thickness S [mm] may be calculated using the following equation:

$$D = \sqrt{0,25 + \frac{1,27 \, x \, L \, x \, S}{1000}}$$
